## Featured SARS-CoV-2 Proteins -Second Wave

We hope you and your family are safe and well during these challenging times!

The COVID-19 outbreak has caused large numbers of death, as well as social and economic chaos worldwide. SARS-CoV-2 virus is the causative agent of this respiratory disease. There are currently no effective antiviral drugs and no preventive vaccines.

At Creative BioMart, we remain fully functional to support your research. We provide a set of SARS-CoV-2 proteins and its target protein. Please reach out for more information. We will be glad to set up a call to discuss your project needs.

So far, the scientific community has known that SARS-CoV-2 binds to host cell receptors through its surface spike (S) proteins and is endocytosed into cells through clathrin-mediated membrane fusion. The relationship and affinity between the host cell receptor and the virus surface protein determine the infectivity and cytophilic characteristics of the virus. The pathogenicity and invading of the virus are related to the type and function of the host cell. Crystal structure analysis confirmed that angiotensin-converting enzyme 2 (ACE2) is the receptor for SARS-CoV-2 S protein, and the affinity of the two is 10-20 times that of SARS-CoV and ACE2, which is the reason of SARS-CoV-2 super infectivity.
